

1. First created the business object by importing the VBO file named as: BPA Object - Email - POP3_SMTP.
2. Then created the process which interacts with the above business object created.
3. In the process, we first configured the email server setting with gmail.
4. The username and password were saved as data items.

5. We made sure that the secure mode is off in the gmail.
6. Created a collection which contains the Field named as 'Path' with datatype as text and then in the initial value, specified the path of the file to be attached as an attachment. We observed that the path should must be in C drive otherwise it generates an error.

8.

9. The final flow for sending the email is as follows:
